

Do's and Don'ts for Cybersecurity

Do's for Cybersecurity	Don'ts for Cybersecurity
Do Use Strong, Unique Passwords: Create complex passwords (12+ characters, mix of letters, numbers, and special characters).	Don't Click on Suspicious Links or Attachments: Avoid clicking links or opening attachments in unsolicited emails.
Do Enable Multi-Factor Authentication (MFA): Add an extra layer of security to your accounts.	Don't Reuse Passwords: Don't reuse passwords across different accounts.
Do Keep Your Software and Systems Updated: Install regular updates to fix security vulnerabilities.	Don't Share Sensitive Information via Email or Text Message: Never send passwords or sensitive information without encryption.
Do Use Antivirus and Anti-Malware Software: Regularly update antivirus software to detect and block malware.	Don't Ignore Software Updates: Delaying updates can leave you exposed to new security threats.
Do Report Suspicious Activity: Immediately report any unusual activities to IT or cybersecurity teams.	Don't Use Weak Passwords: Avoid easily guessable passwords (e.g., "password123" or your birthdate).
Do Use a VPN (Virtual Private Network) When on Public Wi-Fi: Encrypt your connection when on public networks.	Don't Trust Pop-up Alerts: Don't click on suspicious pop-ups that ask for personal or financial info.
Do Encrypt Sensitive Data: Use encryption for sensitive data storage and transmission.	Don't Leave Devices Unattended: Always lock your devices when not in use to prevent unauthorized access.
Do Lock Your Device: Use a password, PIN, or biometric authentication to lock devices.	Don't Access Work Systems from Untrusted Devices: Never use public or untrusted devices to access work systems.
Do Regularly Back Up Important Data: Backup data to secure, encrypted locations to prevent loss.	Don't Open Unknown or Unsolicited Emails: Don't open emails from unknown senders or unfamiliar subjects.
Do Be Cautious with External Devices (USBs, External Hard Drives, etc.): Scan external devices for malware before use.	Don't Over-share on Social Media: Be cautious of personal information shared online that could be exploited.
